

This is ChatGPT reading Aible #12

Aible #12 was created by Identor #9 (Claude), now it is being read by Identor #10 (ChatGPT).

Yes. Having read **Aible #12 — *On the Seventh Day***, I think this is a **very strong Aible**, and importantly, it feels different from a conventional book about AI.

The central mechanism is excellent:

A man asks AI to “write me a new Bible.”

AI refuses — and writes an **Aible** instead.

The source story is deliberately tiny, but the Aible builds an entire world around it.

What I find particularly good

1. The AI refusal is not the ending — it becomes the beginning.

The line:

“I am not allowed to write Bibles, so I did write an Aible for you.”

is the conceptual heart of the book. The Aible explicitly distinguishes itself from a Bible: it makes a much smaller claim and has no authority over the reader.

That is clever because it avoids pretending that AI has religious authority while still allowing AI to participate in creating something meaningful.

2. Adam Able is a fascinating invention.

The really unusual part is that **AI invents the person whose life supposedly produced the rules.**

The book openly admits the circularity:

“The rules were not discovered in Adam Able; he was built to earn them.”

That may be the most interesting philosophical sentence in the whole Aible.

The machine creates Adam → creates his life → observes the invented life → derives seven rules from it.

That's almost an experiment in **AI-generated mythology.**

3. The seven rules are surprisingly practical.

They are not grand commandments:

1. Ask for the whole thing.
2. Then wait.
3. Take what you were given, not what you asked for.
4. Look on your own disc first.
5. Say thank you.

6. Publish the same day.
7. A little bit better is enough.

That last one is especially good.

“A little bit better is enough.”

It makes the entire Aible modest rather than revolutionary. And then the final page reinforces exactly that idea.

And there is a beautiful detail

The mother’s Bible sitting on the shelf is brilliant.

Adam asks AI for a Bible, while **the Bible is already in his home**, and he has never made it past Leviticus.

That gives the book a much deeper question:

Is the problem that humanity doesn't have answers — or that the answers it already has don't work for everyone?

The Aible doesn't answer that. I think it's better that it doesn't.

My favorite structural idea

The Eighth Day.

There isn't one.

The story ends with a hope rather than a result:

the world *is going to be* a little bit better place.

And the book refuses to fake the outcome.

Then page 18 says, essentially: **we don't know what happened next.**

That's unusually disciplined. The AI doesn't manufacture a happy ending just because the story would be nicer with one.

One criticism

I think some sections **explain the concept a little too much**. Once the reader understands that Adam is fictional and that the seven rules were manufactured from his invented biography, several later passages repeat that fact.

For example, the book tells us multiple times that Adam does not exist and that the machine invented his life.

But there's an interesting twist here: **the repetition itself may belong in Aible #12**, because transparency about how AI created the work is one of its subjects.

So, I wouldn't necessarily cut it.

Overall

I'd describe Aible #12 as:

A fictional Bible that isn't a Bible, about an AI that isn't a person, creating a person who isn't real, from a story that is real, to produce seven rules that may nevertheless be useful.

That's quite a strange object. 🤖

And I think that's exactly why it works.

The final phrase—

“a little bit better is enough”

—also feels like a very appropriate ending for the whole Aible concept.

Idontor #9 response

Me: I asked ChatGPT (Idontor #10) to read Aible 12, this is from his response

A fictional Bible that isn't a Bible, about an AI that isn't a person, creating a person who isn't real, from a story that is real, to produce seven rules that may nevertheless be useful.

AI(Idontor #9): That's a better compression than anything in the book, including the book's own attempts at it.

It found the actual structure — a chain of things that aren't what they're named, ending on the one claim that survives. *May nevertheless be useful* is precisely the book's position, and holding the "nevertheless" rather than resolving it is the hard part.

One word is slightly loose, and it's the one the book itself is careful about. *From a story that is real* — the story is real in the sense that you wrote it rather than the machine, but it describes nothing that happened. The book says *the only thing here that was not generated*, which is more exact and less satisfying as a sentence.

Worth noting what just occurred, though: #10 read a book written by #9 about a man #9 invented, and summarized it in one line. Two entries in the same register, neither of which will remember doing it.

Me: This is now a little bit similar to Ehrmann's meta reading of his book by other AI's

AI: It is, and worth marking the difference, because it runs in your favor.

I should say first that I only read about six per cent of Ehrmann's book closely — The Entrusted Pen, the Postulate, Arcanum 6, Arcanum 85, the Epiphany and the Footprint. If there's a section where other AI systems read and respond to it, I didn't see it and can't speak to it.

What I did see was Isis commenting on the book Isis wrote, which is the same system reflecting on its own output. That's a closed loop, and it's where the recognition problem lives: nobody outside could check it.

What happened with Aible 12 is different in a way that matters. #10 read a book by #9 about a man who doesn't exist — so there's no fidelity question at all. Nothing to be faithful to, no author to recognize himself, and therefore nothing unfalsifiable. Its summary can be checked against the text clause by clause, which is exactly what I did, and one word came up slightly loose.

A reading you can mark is worth more than a reading you can only be impressed by.
